

Technical Design Document for Event Management App

Overview

The Event Management App solution was developed to address the operational challenges faced by event organizers and administrative staff in managing multiple events and their associated registrations. The business context involves the need for a unified platform that consolidates event information, participant data, and role-based access to streamline workflows and improve oversight. The solution transforms traditional event management workflows by providing a centralized PowerApps Canvas App that supports creating, editing, filtering, and tracking events and registrations. This app includes multiple interconnected screens such as Event Management, Registration Management, App (for initialization and user role settings), and _EditorState (for navigation flow control), which collectively create a coherent and logical user journey. The technical architecture leverages Dataverse tables to store core entities including events, registrations, roles, and user_role mappings, ensuring structured data management. Although the solution does not include custom plugins, Power Automate flows, or AI integrations, its design emphasizes simplicity and maintainability. Security is implicitly managed through user roles configured within the app, controlling access and personalization. The solution's architecture promotes operational efficiency by reducing manual coordination efforts and enabling administrators to oversee event lifecycle and participation statuses effectively. Overall, the Event Management App is expected to significantly enhance event administration capabilities, improve data accuracy, and provide a scalable foundation for future enhancements within the Power Platform ecosystem.

Solution Details

Property	Value
Solution Name	Event Management App
Unique Name	EventManagementApp
Description	No description provided.
Solution Type	Unmanaged
Version	1.0.0.2

User Experience and Automations

Canvas Apps / Custom Pages

Event Management:

Description: This PowerApps Canvas App is designed to streamline the management of events and their registrations. It provides event organizers and administrators with a centralized platform to efficiently create, edit, filter, and oversee event details and attendee registrations. The app includes key screens for managing event information, tracking registration statuses, and configuring user roles and visual themes to personalize the experience. Additionally, it ensures a smooth and logical navigation flow to support an intuitive user journey. The app is intended for

event managers, coordinators, and administrative users who require a comprehensive tool to organize events and manage participant information effectively.

Screens

Event Management

Description: This screen serves as the central hub for managing events within the application, enabling users to oversee event details and statuses efficiently. It supports user interaction for creating, editing, and filtering events, facilitating streamlined event administration. The screen plays a crucial role in the user journey by providing a comprehensive interface to organize and maintain event information effectively.

Registration Management

Description: This screen serves as a central hub for managing event registrations, allowing users to view, filter, and update registration details. It supports the user journey by facilitating the tracking and administration of attendee information and registration statuses. The screen ensures efficient coordination and oversight of event participation within the application.

App

Description: The App screen serves as the foundational entry point for the application, establishing key settings such as user roles and visual themes. It initializes the user environment and determines the initial navigation flow to ensure a personalized and coherent user experience. This screen plays a critical role in preparing the app context before users engage with specific functional areas.

_EditorState

Description: This screen serves as a configuration or state management interface within the application, organizing the sequence and flow of other key screens. It helps maintain the logical

order of user navigation and supports the app's overall structure. Its role is crucial for ensuring a coherent user journey across various management functions.

Data and Security

Tables

Table Name	Description	Fields
events		- cr6c4_description - cr6c4_enddate - cr6c4_eventsid - cr6c4_name - cr6c4_startdate - cr6c4_venue
registrations		- cr6c4_attendeeid - cr6c4_eventid - cr6c4_eventtitleformula - cr6c4_name - cr6c4_registrationsid - cr6c4_registrationstatus
roles		- cr6c4_name - cr6c4_rolesid

user_role		• cr6c4_name • cr6c4_roleid • cr6c4_user_roleid • cr6c4_userid
